

Employee Management System - OOP Concepts Used

1. Class and Object

Employee and Manager are classes. Objects of the Manager class are created to represent employee records.

2. Encapsulation

The variables empId, name, and salary are declared as private and accessed through getter and setter methods.

3. Inheritance

The Manager class extends the Employee class, inheriting its properties and methods.

4. Polymorphism

The displayInfo() method is overridden in the Manager class to provide specialized behavior.

5. Arrays

An array of Manager objects is used to store multiple employee records.

6. Loops and Conditions

A for loop is used to display details of all managers, and an if-else statement is used to categorize managers based on salary.

Conclusion

This project demonstrates the fundamental concepts of Object-Oriented Programming in Java and fulfills the project requirements.
